description

The TLC2932 is designed for phase-locked-loop (PLL) systems and is composed of a voltage-controlled oscillator (VCO) and an edge-triggered-type phase frequency detector (PFD). The oscillation frequency range of the VCO is set by an external bias resistor (R$_{BIAS}$). The VCO has a 1/2 frequency divider at the output stage. The high-speed PFD with internal charge pump detects the phase difference between the reference frequency input and signal frequency input from the external counter. Both the VCO and the PFD have inhibit functions, which can be used as a power-down mode. The TLC2932 is suitable for use as a high-performance PLL due to the high speed and stable oscillation capability of the device.

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
FIN−A	4	I	Input reference frequency $f_{(REF\ IN)}$ is applied to FIN−A.
FIN−B	5	I	Input for VCO external counter output frequency $f_{(FIN−B)}$. FIN−B is nominally provided from the external counter.
LOGIC GND	7		GND for the internal logic.
LOGIC V_{DD}	1		Power supply for the internal logic. This power supply should be separate from VCO V_{DD} to reduce cross-coupling between supplies.
NC	8		No internal connection.
PFD INHIBIT	9	I	PFD inhibit control. When PFD INHIBIT is high, PFD output is in the high-impedance state, see Table 3.
PFD OUT	6	O	PFD output. When the PFD INHIBIT is high, PFD output is in the high-impedance state.
BIAS	13	I	Bias supply. An external resistor (R_{BIAS}) between VCO V_{DD} and BIAS supplies bias for adjusting the oscillation frequency range.
SELECT	2	I	VCO output frequency select. When SELECT is high, the VCO output frequency is ×1/2 and when low, the output frequency is ×1, see Table 1.
VCO IN	12	I	VCO control voltage input. Nominally the external loop filter output connects to VCO IN to control VCO oscillation frequency.
VCO INHIBIT	10	I	VCO inhibit control. When VCO INHIBIT is high, VCO OUT is low (see Table 2).
VCO GND	11		GND for VCO.
VCO OUT	3	O	VCO output. When the VCO INHIBIT is high, VCO output is low.
VCO V_{DD}	14		Power supply for VCO. This power supply should be separated from LOGIC V_{DD} to reduce cross-coupling between supplies.

detailed description

VCO oscillation frequency

The VCO oscillation frequency is determined by an external resistor (R_{BIAS}) connected between the VCO V_{DD} and the BIAS terminals. The oscillation frequency and range depends on this resistor value. The bias resistor value for the minimum temperature coefficient is nominally 3.3 kΩ with 3-V at the VCO V_{DD} terminal and nominally 2.2 kΩ with 5-V at the VCO V_{DD} terminal. For the lock frequency range refer to the recommended operating conditions. Figure 1 shows the typical frequency variation and VCO control voltage.

Figure 1. VCO Oscillation Frequency

VCO output frequency 1/2 divider

The TLC2932 SELECT terminal sets the f_{OSC} or 1/2 f_{OSC} VCO output frequency as shown in Table 1. The 1/2 f_{OSC} output should be used for minimum VCO output jitter.

Table 1. VCO Output 1/2 Divider Function

SELECT	VCO OUTPUT
Low	f_{OSC}
High	1/2 f_{OSC}

VCO inhibit function

The VCO has an externally controlled inhibit function which inhibits the VCO output. A high level on the VCO INHIBIT terminal stops the VCO oscillation and powers down the VCO. The output maintains a low level during the power-down mode, refer to Table 2.

Table 2. VCO Inhibit Function

VCO INHIBIT	VCO OSCILLATOR	VCO OUTPUT	$I_{DD(VCO)}$
Low	Active	Active	Normal
High	Stopped	Low level	Power Down

PFD operation

The PFD is a high-speed, edge-triggered detector with an internal charge pump. The PFD detects the phase difference between two frequency inputs supplied to FIN–A and FIN–B as shown in Figure 2. Nominally the reference is supplied to FIN–A, and the frequency from the external counter output is fed to FIN–B.

Figure 2. PFD Function Timing Chart

PFD output control

A high level on the PFD INHIBIT terminal places the PFD output in the high-impedance state and the PFD stops phase detection as shown in Table 3. A high level on the PFD INHIBIT terminal also can be used as the power-down mode for the PFD.
Table 3. VCO Output Control Function

PFD INHIBIT	DETECTION	PFD OUTPUT	$I_{DD(PFD)}$
Low	Active	Active	Normal
High	Stopped	Hi-Z	Power Down

schematics

VCO block schematic

PFD block schematic
absolute maximum ratings[†]

Supply voltage (each supply), V_{DD} (see Note 1) . . . . 7 V

Input voltage range (each input), V_I (see Note 1) . . . . −0.5 V to V_{DD} + 0.5 V

Input current (each input), I_I . . . . ±20 mA

Output current (each output), I_O . . . . ±20 mA

Continuous total power dissipation, at (or below) T_A = 25°C (see Note 2) . . . . 700 mW

Operating free-air temperature range, T_A . . . . −20°C to 75°C

Storage temperature range, T_{stg} . . . . −65°C to 150°C

Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds . . . . 260°C

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1.   All voltage values are with respect to network GND.
2.   For operation above 25°C free-air temperature, derate linearly at the rate of 5.6 mW/°C.

recommended operating conditions

PARAMETER		MIN	NOM	MAX	UNIT
Supply voltage, V_{DD} (each supply, see Note 3)	$V_{DD} = 3$ V	2.85	3	3.15	V
	$V_{DD} = 5$ V	4.75	5	5.25	
Input voltage, V_I (inputs except VCO IN)		0		V_{DD}	V
Output current, I_O (each output)		0		± 2	mA
VCO control voltage at VCO IN		0.9		V_{DD}	V
Lock frequency ($\times 1$ output)	$V_{DD} = 3$ V	14		21	MHz
	$V_{DD} = 5$ V	22		50	
Lock frequency ($\times 1/2$ output)	$V_{DD} = 3$ V	7		10.5	MHz
	$V_{DD} = 5$ V	11		25	
Bias resistor, R_{BIAS}	$V_{DD} = 3$ V	2.2	3.3	4.3	kΩ
	$V_{DD} = 5$ V	1.5	2.2	3.3	

NOTE 3: It is recommended that the logic supply terminal (LOGIC V_{DD}) and the VCO supply terminal (VCO V_{DD}) should be at the same voltage and separated from each other.

APPLICATION INFORMATION

gain of VCO and PFD

Figure 24 is a block diagram of the PLL. The countdown N value depends on the input frequency and the desired VCO output frequency according to the system application requirements. The K_p and K_V values are obtained from the operating characteristics of the device as shown in Figure 24. K_p is defined from the phase detector V_{OL} and V_{OH} specifications and the equation shown in Figure 24(b). K_V is defined from Figures 8, 9, 10, and 11 as shown in Figure 24(c).

The parameters for the block diagram with the units are as follows:

K_V : VCO gain (rad/s/V)
K_p : PFD gain (V/rad)
K_f : LPF gain (V/V)
K_N : count down divider gain (1/N)

external counter

When a large N counter is required by the application, there is a possibility that the PLL response becomes slow due to the counter response delay time. In the case of a high frequency application, the counter delay time should be accounted for in the overall PLL design.

$$K_p = \frac{V_{OH} - V_{OL}}{4\pi}$$

(b)

$$K_V = \frac{2\pi(f_{MAX} - f_{MIN})}{V_{IN\ MAX} - V_{IN\ MIN}}$$

(c)

Figure 24. Example of a PLL Block Diagram

R_{BIAS}

The external bias resistor sets the VCO center frequency with 1/2 V_{DD} applied to the VCO IN terminal. However, for optimum temperature performance, a resistor value of 3.3 kΩ with a 3-V supply and a resistor value of 2.5 kΩ for a 5-V supply is recommended. For the most accurate results, a metal-film resistor is the better choice but a carbon-compositiion resistor can be used with excellent results also. A 0.22 μF capacitor should be connected from the BIAS terminal to ground as close to the device terminals as possible.

hold-in range

From the technical literature, the maximum hold-in range for an input frequency step for the three types of filter configurations shown in Figure 25 is as follows:

$$\Delta\omega_H \simeq 0.8 \left(K_p\right)\left(K_V\right)\left(K_f\left(\infty\right)\right)$$

Where

$K_f\left(\infty\right)$ = the filter transfer function value at $\omega = \infty$

![Texas Instruments logo]
TEXAS INSTRUMENTS

APPLICATION INFORMATION

low-pass-filter (LPF) configurations

Many excellent references are available that include detailed design information about LPFs and should be consulted for additional information. Lag-lead filters or active filters are often used. Examples of LPFs are shown in Figure 25. When the active filter of Figure 25(c) is used, the reference should be applied to FIN-B because of the amplifier inversion. Also, in practical filter implementations, C2 is used as additional filtering at the VCO input. The value of C2 should be equal to or less than one tenth the value of C1.

(a) LAG FILTER

(b) LAG-LEAD FILTER
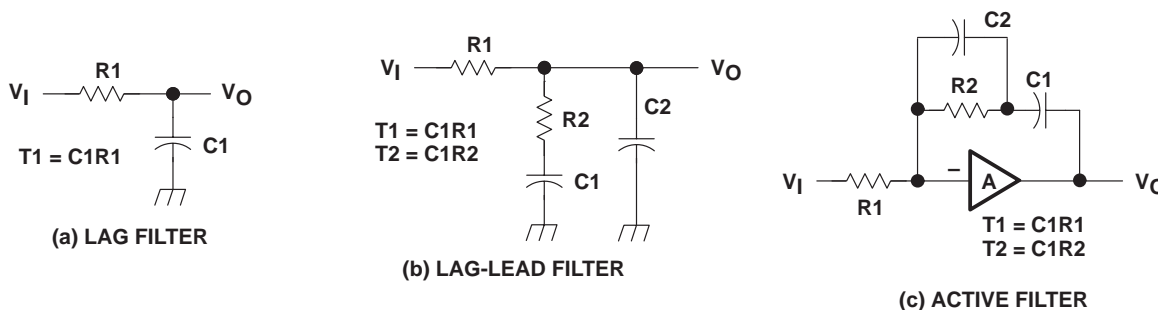

(c) ACTIVE FILTER

Figure 25. LPF Examples for PLL

the passive filter

The transfer function for the lag-lead filter shown in Figure 25(b) is;

$$\frac{V_O}{V_{IN}} = \frac{1 + s \cdot T2}{1 + s \cdot (T1 + T2)}$$

Where

$$T1 = R1 \cdot C1 \text{ and } T2 = R2 \cdot C1$$

Using this filter makes the closed loop PLL system a second-order type 1 system. The response curves of this system to a unit step are shown in Figure 26.

the active filter

When using the active integrator shown in Figure 25(c), the phase detector inputs must be reversed since the integrator adds an additional inversion. Therefore, the input reference frequency should be applied to the FIN-B terminal and the output of the VCO divider should be applied to the input reference terminal, FIN-A.

The transfer function for the active filter shown in Figure 25(c) is:

$$F(s) = \frac{1 + s \cdot R2 \cdot C1}{s \cdot R1 \cdot C1}$$

Using this filter makes the closed loop PLL system a second-order type 2 system. The response curves of this system to a unit step are shown in Figure 27.

basic design example

The following design example presupposes that the input reference frequency and the required frequency of the VCO are within the respective ranges of the device.

TEXAS
INSTRUMENTS

POST OFFICE BOX 655303 ● DALLAS, TEXAS 75265

APPLICATION INFORMATION

basic design example (continued)

Assume the loop has to have a 100 μs settling time (t_s) with a countdown N = 8. Using the Type 1, second order response curves of Figure 26, a value of 4.5 radians is selected for $\omega_n t_s$ with a damping factor of 0.7. This selection gives a good combination for settling time, accuracy, and loop gain margin. The initial parameters are summarized in Table 5. The loop constants, K_V and K_p, are calculated from the data sheet specifications and Table 6 shows these values.

The natural loop frequency is calculated as follows:

Since

$$\omega_n t_s = 4.5$$

Then

$$\omega_n = \frac{4.5}{100\ \mu s} = 45\ \text{k-radians/sec}$$

Table 5. Design Parameters

PARAMETER	SYMBOL	VALUE	UNITS

TEXAS INSTRUMENTS

TLC2932
HIGH-PERFORMANCE PHASE-LOCKED LOOP

APPLICATION INFORMATION

Using the low-pass filter in Figure 25(b) and divider ratio N, the transfer function for phase and frequency are shown in equations 1 and 2. Note that the transfer function for phase differs from the transfer function for frequency by only the divider value N. The difference arises from the fact that the feedback for phase is unity while the feedback for frequency is 1/N.

Hence, transfer function of Figure 24 (a) for phase is

$$\frac{\Phi 2(s)}{\Phi 1(s)} = \frac{K_p \cdot K_V}{N \cdot (T1 + T2)} \left[\frac{1 + s \cdot T2}{s^2 + s \left[1 + \frac{K_p \cdot K_V \cdot T2}{N \cdot (T1 + T2)} \right] + \frac{K_p \cdot K_V}{N \cdot (T1 + T2)}} \right] \tag{1}$$

and the transfer function for frequency is

$$\frac{F_{OUT}(s)}{F_{REF}(s)} = \frac{K_p \cdot K_V}{(T1 + T2)} \left[\frac{1 + s \cdot T2}{s^2 + s \cdot \left[1 + \frac{K_p \cdot K_V \cdot T2}{N \cdot (T1 + T2)} \right] + \frac{K_p \cdot K_V}{N \cdot (T1 + T2)}} \right] \tag{2}$$

The standard two-pole denominator is $D = s^2 + 2 \zeta \omega_n s + \omega_n^2$ and comparing the coefficients of the denominator of equation 1 and 2 with the standard two-pole denominator gives the following results.

$$\omega_n = \sqrt{\frac{K_p \cdot K_V}{N \cdot (T1 + T2)}}$$

Solving for T1 + T2

$$T1 + T2 = \frac{K_p \cdot K_V}{N \cdot \omega_n^2} \tag{3}$$

and by using this value for T1 + T2 in equation 3 the damping factor is

$$\zeta = \frac{\omega_n}{2} \cdot \left(T2 + \frac{N}{K_p \cdot K_V} \right)$$

solving for T2

$$T2 = \frac{2 \zeta}{\omega} - \frac{N}{K_p \cdot K_V}$$

then by substituting for T2 in equation 3

$$T1 = \frac{K_V \cdot K_p}{N \cdot \omega_n^2} - \frac{2 \zeta}{\omega_n} + \frac{N}{K_p \cdot K_V}$$

APPLICATION INFORMATION

From the circuit constants and the initial design parameters then

$$R2 = \left[\frac{2\,\zeta}{\omega_n} - \frac{N}{K_p \cdot K_V} \right] \frac{1}{C1}$$

$$R1 = \left[\frac{K_p \cdot K_V}{\omega_n^2 \cdot N} - \frac{2\,\zeta}{\omega_n} + \frac{N}{K_p \cdot K_V} \right] \frac{1}{C1}$$

The capacitor, C1, is usually chosen between 1 μF and 0.1 μF to allow for reasonable resistor values and physical capacitor size. In this example, C1 is chosen to be 0.1 μF and the corresponding R1 and R2 calculated values are listed in Table 7.

PCB layout considerations

The TLC2932 contains a high frequency analog oscillator; therefore, very careful breadboarding and printed-circuit-board (PCB) layout is required for evaluation.

The following design recommendations benefit the TLC2932 user:

- External analog and digital circuitry should be physically separated and shielded as much as possible to reduce system noise.

- RF breadboarding or RF PCB techniques should be used throughout the evaluation and production process.

- Wide ground leads or a ground plane should be used on the PCB layouts to minimize parasitic inductance and resistance. The ground plane is the better choice for noise reduction.

- LOGIC V_{DD} and VCO V_{DD} should be separate PCB traces and connected to the best filtered supply point available in the system to minimize supply cross-coupling.

- VCO V_{DD} to GND and LOGIC V_{DD} to GND should be decoupled with a 0.1-µF capacitor placed as close as possible to the appropriate device terminals.

- The no-connection (NC) terminal on the package should be connected to GND.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.
