### Features

- High-performance, Low-power AVR<sup>®</sup> 8-bit Microcontroller
- Advanced RISC Architecture
  - 130 Powerful Instructions Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers + Peripheral Control Registers
  - Fully Static Operation
  - Up to 16 MIPS Throughput at 16 MHz
  - On-chip 2-cycle Multiplier
- Non-volatile Program and Data Memories
  - 64K Bytes of In-System Reprogrammable Flash Endurance: 10,000 Write/Erase Cycles
  - Optional Boot Code Section with Independent Lock Bits In-System Programming by On-chip Boot Program True Read-While-Write Operation
  - 2K Bytes EEPROM
  - Endurance: 100,000 Write/Erase Cycles
  - 4K Bytes Internal SRAM
  - Up to 64K Bytes Optional External Memory Space
  - Programming Lock for Software Security
  - SPI Interface for In-System Programming
- JTAG (IEEE std. 1149.1 Compliant) Interface
  - Boundary-scan Capabilities According to the JTAG Standard
  - Extensive On-chip Debug Support
  - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescalers and Compare Modes
  - Two Expanded 16-bit Timer/Counters with Separate Prescaler, Compare Mode, and Capture Mode
  - Real Time Counter with Separate Oscillator
  - Two 8-bit PWM Channels
  - 6 PWM Channels with Programmable Resolution from 1 to 16 Bits
  - 8-channel, 10-bit ADC
    - 8 Single-ended Channels
    - 7 Differential Channels
    - 2 Differential Channels with Programmable Gain (1x, 10x, 200x)
  - Byte-oriented Two-wire Serial Interface
  - Dual Programmable Serial USARTs
  - Master/Slave SPI Serial Interface
  - Programmable Watchdog Timer with On-chip Oscillator
  - On-chip Analog Comparator
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated RC Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby and Extended Standby
  - Software Selectable Clock Frequency
  - ATmega103 Compatibility Mode Selected by a Fuse
  - Global Pull-up Disable
- I/O and Packages
  - 53 Programmable I/O Lines
  - 64-lead TQFP and 64-pad MLF
- Operating Voltages
  - 2.7 5.5V for ATmega64L
  - 4.5 5.5V for ATmega64
- Speed Grades
  - 0 8 MHz for ATmega64L
  - 0 16 MHz for ATmega64

AMEL

8-bit **AVR**<sup>®</sup> Microcontroller with 64K Bytes In-System Programmable Flash

ATmega64 ATmega64L

# Summary

2490IS-AVR-11/04

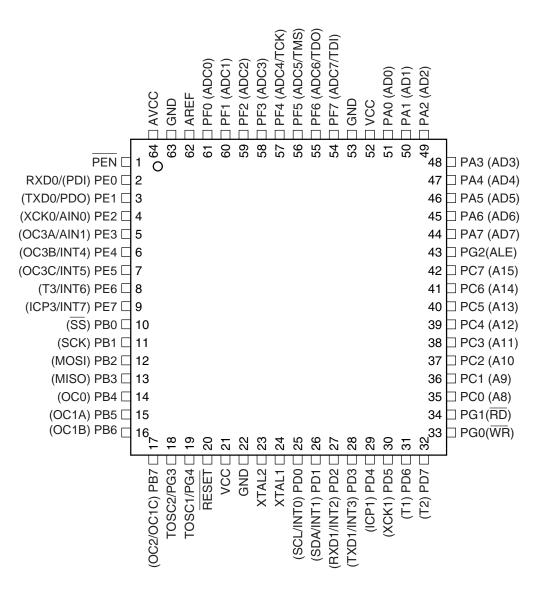

Note: This is a summary document. A complete document is available on our Web site at www.atmel.com.

### **Pin Configuration**

Figure 1. Pinout ATmega64

**TQFP/MLF** 

Disclaimer

Typical values contained in this data sheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device is characterized.

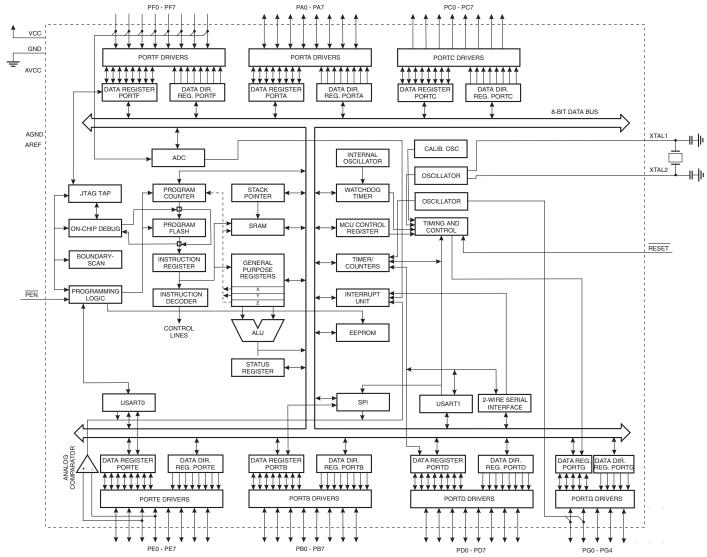

# <sup>2</sup> ATmega64(L)

### **Overview**

The ATmega64 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega64 achieves throughputs approaching 1 MIPS per MHz, allowing the system designer to optimize power consumption versus processing speed.

### **Block Diagram**

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega64 provides the following features: 64K bytes of In-System Programmable Flash with Read-While-Write capabilities, 2K bytes EEPROM, 4K bytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, two USARTs, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming, and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Powerdown mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except asynchronous timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the asynchronous timer continue to run.

The device is manufactured using Atmel's high-density non-volatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional non-volatile memory programmer, or by an On-chip Boot program running on the AVR core. The Boot Program can use any interface to download the Application Program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega64 is a powerful microcontroller that provides a highly-flexible and cost-effective solution to many embedded control applications.

The ATmega64 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, In-Circuit Emulators, and evaluation kits.

#### ATmega103 and ATmega64 Compatibility The ATmega64 is a highly complex microcontroller where the number of I/O locations supersedes the 64 I/O location reserved in the AVR instruction set. To ensure backward compatibility with the ATmega103, all I/O locations present in ATmega103 have the same location in ATmega64. Most additional I/O locations are added in an Extended I/O space starting from 0x60 to 0xFF (i.e., in the ATmega103 internal RAM space). These location can be reached by using LD/LDS/LDD and ST/STS/STD instructions only, not by using IN and OUT instructions. The relocation of the internal RAM space may still be a problem for ATmega103 users. Also, the increased number of Interrupt Vectors might be a problem if the code uses absolute addresses. To solve these problems, an ATmega103 compatibility mode can be selected by programming the fuse M103C. In this mode, none of the functions in the Extended I/O space are in use, so the internal RAM is located as in ATmega103. Also, the extended Interrupt Vectors are removed.

The ATmega64 is 100% pin compatible with ATmega103, and can replace the ATmega103 on current printed circuit boards. The application notes "Replacing ATmega103 by ATmega128" and "Migration between ATmega64 and ATmega128" describes what the user should be aware of replacing the ATmega103 by an ATmega128 or ATmega64.

#### ATmega103 Compatibility Mode

By programming the M103C Fuse, the ATmega64 will be compatible with the ATmega103 regards to RAM, I/O pins and Interrupt Vectors as described above. However, some new features in ATmega64 are not available in this compatibility mode, these features are listed below:

- One USART instead of two, asynchronous mode only. Only the eight least significant bits of the Baud Rate Register is available.
- One 16 bits Timer/Counter with two compare registers instead of two 16 bits Timer/Counters with three compare registers.
- Two-wire serial interface is not supported.
- Port G serves alternate functions only (not a general I/O port).
- Port F serves as digital input only in addition to analog input to the ADC.
- Boot Loader capabilities is not supported.
- It is not possible to adjust the frequency of the internal calibrated RC Oscillator.
- The External Memory Interface can not release any Address pins for general I/O, neither configure different wait states to different External Memory Address sections.
- Only EXTRF and PORF exist in the MCUCSR Register.
- No timed sequence is required for Watchdog Timeout change.
- Only low-level external interrupts can be used on four of the eight External Interrupt sources.
- Port C is output only.
- USART has no FIFO buffer, so Data OverRun comes earlier.
- The user must have set unused I/O bits to 0 in ATmega103 programs.

#### **Pin Descriptions**

VCC	Digital supply voltage.
GND	Ground.
Port A (PA7PA0)	Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.
	Port A also serves the functions of various special features of the ATmega64 as listed on page 72.
Port B (PB7PB0)	Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.
	Port B also serves the functions of various special features of the ATmega64 as listed

on page 73.

Port C (PC7PC0)	Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.
	Port C also serves the functions of special features of the ATmega64 as listed on page 76. In ATmega103 compatibility mode, Port C is output only, and the port C pins are <b>not</b> tri-stated when a reset condition becomes active.
Port D (PD7PD0)	Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.
	Port D also serves the functions of various special features of the ATmega64 as listed on page 77.
Port E (PE7PE0)	Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.
	Port E also serves the functions of various special features of the ATmega64 as listed on page 80.
Port F (PF7PF0)	Port F serves as the analog inputs to the A/D Converter.
	Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resis- tors on pins PF7(TDI), PF5(TMS) and PF4(TCK) will be activated even if a reset occurs.
	The TDO pin is tri-stated unless TAP states that shift out data are entered.
	Port F also serves the functions of the JTAG interface.
	In ATmega103 compatibility mode, Port F is an input port only.
Port G (PG4PG0)	Port G is a 5-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.
	Port G also serves the functions of various special features.
	In ATmega103 compatibility mode, these pins only serves as strobes signals to the external memory as well as input to the 32 kHz Oscillator, and the pins are initialized to $PG0 = 1$ , $PG1 = 1$ , and $PG2 = 0$ asynchronously when a reset condition becomes active, even if the clock is not running. PG3 and PG4 are Oscillator pins.

RESET	Reset input. A low level on this pin for longer than the minimum pulse length will gener- ate a reset, even if the clock is not running. The minimum pulse length is given in Table 19 on page 51. Shorter pulses are not guaranteed to generate a reset.
XTAL1	Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.
XTAL2	Output from the inverting Oscillator amplifier.
AVCC	AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to $V_{CC}$ through a low-pass filter.
AREF	AREF is the analog reference pin for the A/D Converter.
PEN	This is a programming enable pin for the SPI Serial Programming mode. By holding this pin low during a Power-on Reset, the device will enter the SPI Serial Programming mode. PEN has no function during normal operation.

## **Register Summary (Continued)**

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Page
0x00 (0x20)	PINF	PINF7	PINF6	PINF5	PINF4	PINF3	PINF2	PINF1	PINF0	88

Notes: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

2. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O Register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.

## Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AN	ID LOGIC INSTRUC	TIONS			
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	$Rdh:RdI \leftarrow Rdh:RdI + K$	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	$Rd \leftarrow Rd - Rr$	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	$Rd \leftarrow Rd - K$	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	$Rd \leftarrow Rd - Rr - C$	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	$Rd \leftarrow Rd - K - C$	Z,C,N,V,H	1
SBIW	Rdl,K	Subtract Immediate from Word	Rdh:Rdl ← Rdh:Rdl - K	Z,C,N,V,S	2
AND	Rd, Rr	Logical AND Registers	$Rd \leftarrow Rd \bullet Rr$	Z,N,V	1
ANDI	Rd, K	Logical AND Register and Constant	$Rd \leftarrow Rd \bullet K$	Z,N,V	1
OR	Rd, Rr	Logical OR Registers	$Rd \leftarrow Rd \vee Rr$	Z,N,V	1
ORI	Rd, K	Logical OR Register and Constant	$Rd \leftarrow Rd \lor K$	Z,N,V	1
EOR	Rd, Rr	Exclusive OR Registers	$Rd \leftarrow Rd \oplus Rr$	Z,N,V	1
COM	Rd	One's Complement	$Rd \leftarrow 0xFF - Rd$	Z,C,N,V	1
NEG	Rd	Two's Complement	Rd ← 0x00 – Rd	Z,C,N,V,H	1
SBR	Rd,K	Set Bit(s) in Register	$Rd \leftarrow Rd \vee K$	Z,N,V	1
CBR	Rd,K	Clear Bit(s) in Register	$Rd \leftarrow Rd \bullet (0xFF - K)$	Z,N,V	1
INC	Rd		Rd ← Rd + 1	Z,N,V	1
DEC	Rd	Decrement	$Rd \leftarrow Rd - 1$	Z,N,V	1
TST	Rd	Test for Zero or Minus	$Rd \leftarrow Rd \bullet Rd$	Z,N,V	1
CLR	Rd	Clear Register	$Rd \leftarrow Rd \oplus Rd$	Z,N,V	1
SER	Rd	Set Register	Rd ← 0xFF	None	1
MUL	Rd, Rr	Multiply Unsigned	$R1:R0 \leftarrow Rd x Rr$	Z,C	2
MULS	Rd, Rr	Multiply Signed	$R1:R0 \leftarrow Rd \times Rr$	Z,C	2
MULSU	Rd, Rr	Multiply Signed with Unsigned	$R1:R0 \leftarrow Rd x Rr$	Z,C	2
FMUL	Rd, Rr	Fractional Multiply Unsigned	R1:R0 " (Rd x Rr) << 1	Z,C	2
FMULS	Rd, Rr	Fractional Multiply Signed	R1:R0 " (Rd x Rr) << 1	Z,C	2
FMULSU	Rd, Rr	Fractional Multiply Signed with Unsigned	R1:R0 " (Rd x Rr) << 1	Z,C	2
BRANCH INSTRUC					
RJMP	k	Relative Jump	$PC \leftarrow PC + k + 1$	None	2
IJMP		Indirect Jump to (Z)		None	2
JMP	k	Direct Jump	PC ← k	None	3
RCALL	k	Relative Subroutine Call	$PC \leftarrow PC + k + 1$	None	3
ICALL		Indirect Call to (Z)		None	3
CALL	k	Direct Subroutine Call		None	4
RET		Subroutine Return	PC ← STACK	None	4
RETI		Interrupt Return			4
CPSE	Rd,Rr	Compare, Skip if Equal	if $(Rd = Rr) PC \leftarrow PC + 2 \text{ or } 3$	None	1/2/3
CP	Rd,Rr	Compare	Rd – Rr	Z, N,V,C,H	1
CPC	Rd,Rr	Compare with Carry	Rd – Rr – C	Z, N,V,C,H	1
CPI	Rd,K	Compare Register with Immediate	Rd – K	Z, N,V,C,H	1
SBRC	Rr, b	Skip if Bit in Register Cleared	if $(\text{Rr}(b)=0) \text{ PC} \leftarrow \text{PC} + 2 \text{ or } 3$	None	1/2/3
SBRS	Rr, b	Skip if Bit in Register is Set	if $(\text{Rr}(b)=1) \text{PC} \leftarrow \text{PC} + 2 \text{ or } 3$	None	1/2/3
SBIC	P, b	Skip if Bit in I/O Register Cleared	if $(P(b)=0) PC \leftarrow PC + 2 \text{ or } 3$	None	1/2/3
SBIS	P, b	Skip if Bit in I/O Register is Set	if $(P(b)=1) PC \leftarrow PC + 2 \text{ or } 3$	None	1/2/3

# Instruction Set Summary (Continued)

CLH		Clear Half Carry Flag in SREG	H ← 0	Н	1
MCU CONTROL INS	TRUCTIONS				
NOP		No Operation		None	1
SLEEP		Sleep	(see specific descr. for Sleep function)	None	1
WDR		Watchdog Reset	(see specific descr. for WDR/timer)	None	1
BREAK		Break	For On-chip Debug Only	None	N/A

### **Ordering Information**

Speed (MHz)	Power Supply	Ordering Code	Package <sup>(1)</sup>	Operation Range
		ATmega64L-8AC	64A	Commercial
		ATmega64L-8MC	64M1	(0°C to 70°C)
8	2.7 - 5.5	ATmega64L-8AI	64A	le du stais l
		ATmega64L-8MI	64M1	Industrial
		ATmega64L-8MU	64M1 <sup>(2)</sup>	(-40°C to 85°C)
		ATmega64-16AC	64A	Commercial
		ATmega64-16MC	64M1	(0°C to 70°C)
16	4.5 - 5.5	ATmega64-16AI	64A	la du atvia l
		ATmega64-16MI	64M1	Industrial
		ATmega64-16MU	64M1 <sup>(2)</sup>	(-40°C to 85°C)

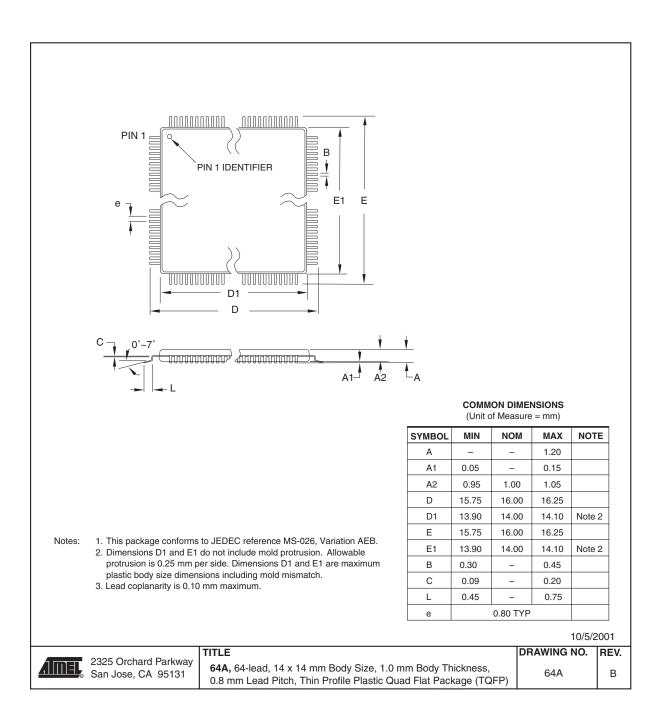

Note: 1. This device can also be supplied in wafer form. Please contact your local Atmel sales office for detailed ordering information and minimum quantities.

2. Pb-free packaging alternative, complies to the European Directive for Restriction of Hazardous Substances (RoHS directive). Also Halide free and fully Green.

Package Type					
64A	64A 64-lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)				
64M1	64-pad, 9 x 9 x 1.0 mm body, lead pitch 0.50 mm, Micro Lead Frame Package (MLF)				

### **Packaging Information**

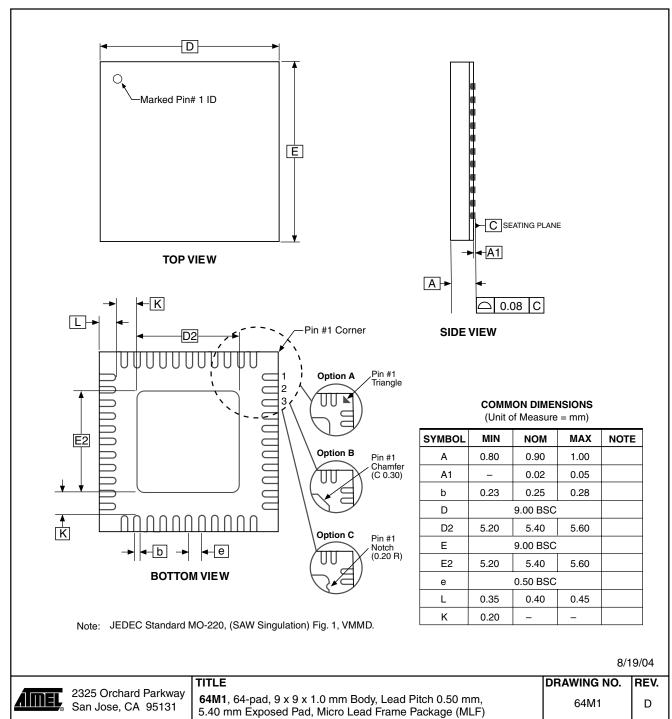

64A

### Errata

The revision letter in this section refers to the revision of the ATmega64 device.

ATmega64, all rev.

- Stabilizing time needed when changing XDIV Register
- Stabilizing time needed when changing OSCCAL Register

#### 1. Stabilizing time needed when changing XDIV Register

After increasing the source clock frequency more than 2% with settings in the XDIV register, the device may execute some of the subsequent instructions incorrectly.

#### Problem Fix / Workaround

The NOP instruction will always be executed correctly also right after a frequency change. Thus, the next 8 instructions after the change should be NOP instructions. To ensure this, follow this procedure:

1.Clear the I bit in the SREG Register.

- 2.Set the new pre-scaling factor in XDIV register.
- 3. Execute 8 NOP instructions
- 4.Set the I bit in SREG

This will ensure that all subsequent instructions will execute correctly. Assembly Code Example:

	-		•	
CLI			;	clear global interrupt enable
OUT	XDIV,	temp	;	set new prescale value
NOP			;	no operation
NOP			;	no operation
NOP			;	no operation
NOP			;	no operation
NOP			;	no operation
NOP			;	no operation
NOP			;	no operation
NOP			;	no operation
SEI			;	clear global interrupt enable

#### 2. Stabilizing time needed when changing OSCCAL Register

After increasing the source clock frequency more than 2% with settings in the OSC-CAL register, the device may execute some of the subsequent instructions incorrectly.

#### Problem Fix / Workaround

The behavior follows errata number 1., and the same Fix / Workaround is applicable on this errata.

A proposal for solving problems regarding the JTAG instruction IDCODE is presented below.

#### IDCODE masks data from TDI input

The public but optional JTAG instruction IDCODE is not implemented correctly according to IEEE1149.1; a logic one is scanned into the shift register instead of the TDI input while shifting the Device ID Register. Hence, captured data from the preceding devices in the boundary scan chain are lost and replaced by all-ones, and data to succeeding devices are replaced by all-ones during Update-DR.

If ATmega64 is the only device in the scan chain, the problem is not visible.

#### Problem Fix / Workaround

Select the Device ID Register of the ATmega64 (Either by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller) to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Note that data to succeeding devices cannot be entered during this scan, but data to preceding devices can. Issue the BYPASS instruction to the ATmega64 to select its Bypass Register while reading the Device ID Registers of preceding devices of the boundary scan chain. Never read data from succeeding devices in the boundary scan chain or upload data to the succeeding devices while the Device ID Register is selected for the ATmega64. Note that the IDCODE instruction is the default instruction selected by the Test-Logic-Reset state of the TAP-controller.

#### Alternative Problem Fix / Workaround

If the Device IDs of all devices in the boundary scan chain must be captured simultaneously (for instance if blind interrogation is used), the boundary scan chain can be connected in such way that the ATmega64 is the fist device in the chain. Update-DR will still not work for the succeeding devices in the boundary scan chain as long as IDCODE is present in the JTAG Instruction Register, but the Device ID registered cannot be uploaded in any case.

### Datasheet Revision History

Changes from Rev. 2490H-10/04 to Rev. 2490I-11/04

Changes from Rev. 2490G-03/04 to Rev. 2490H-10/04 Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

- 1. Removed "Preliminary" and TBD's.
- 2. Updated Table 8 on page 38, Table 11 on page 40, Table 19 on page 51, Table 132 on page 329, Table 134 on page 332.
- 3. Updated features in "Analog to Digital Converter" on page 231.
- 4. Updated "Electrical Characteristics" on page 327.
- 1. Removed references to Analog Ground, IC1/IC3 changed to ICP1/ICP3, Input Capture Trigger changed to Input Capture Pin.
- 2. Updated "ATmega103 and ATmega64 Compatibility" on page 4.
- 3. Updated "External Memory Interface" on page 25
- 4. Updated "XTAL Divide Control Register XDIV" to "Clock Sources" on page 36.
- 5. Updated code example in "Watchdog Timer Control Register WDTCR" on page 56.
- 6. Added section "Unconnected Pins" on page 70.
- 7. Updated Table 19 on page 51, Table 20 on page 55, Table 95 on page 237, and Table 60 on page 134.
- 8. Updated Figure 116 on page 240.
- 9. Updated "Version" on page 256.
- 10. Updated "DC Characteristics" on page 327.
- 11. Updated "ATmega64 Typical Characteristics" on page 342.
- 12. Updated features in "Analog to Digital Converter" on page 231 and Table 136 on page 335.
- 13. Updated "Ordering Information" on page 14.
- 1. Updated "Errata" on page 17.

Changes from Rev. 2490F-12/03 to Rev. 2490G-03/04

Changes from Rev. 2490E-09/03 to Rev. 2490F-12/03 1. Updated "Calibrated Internal RC Oscillator" on page 41.

Changes from Rev. 2490D-02/03 to Rev. 2490E-09/03

- 1. Updated note in "XTAL Divide Control Register XDIV" on page 37.
- 2. Updated "JTAG Interface and On-chip Debug System" on page 49.
- 3. Updated "Test Access Port TAP" on page 249 regarding JTAGEN.
- 4. Updated description for the JTD bit on page 259.
- 5. Added a note regarding JTAGEN fuse to Table 118 on page 293.
- 6. Updated R<sub>PU</sub> values in "DC Characteristics" on page 327.
- 7. Updated "ADC Characteristics" on page 334.
- 8. Added a proposal for solving problems regarding the JTAG instruction IDCODE in "Errata" on page 17.

Changes from Rev. 2490C-09/02 to Rev. 2490D-02/03

- 1. Added reference to Table 124 on page 297 from both SPI Serial Programming and Self Programming to inform about the Flash page size.
- 2. Added Chip Erase as a first step under "Programming the Flash" on page 324 and "Programming the EEPROM" on page 325.
- 3. Corrected OCn waveforms in Figure 52 on page 125.
- 4. Various minor Timer1 corrections.
- 5. Improved the description in "Phase Correct PWM Mode" on page 100 and on page 153.
- 6. Various minor TWI corrections.
- 7. Added note under "Filling the Temporary Buffer (Page Loading)" about writing to the EEPROM during an SPM page load.
- 8. Removed ADHSM completely.
- 9. Added note about masking out unused bits when reading the Program Counter in "Stack Pointer" on page 12.
- 10. Added section "EEPROM Write During Power-down Sleep Mode" on page 23.
- 11. Changed  $V_{HYST}$  value to 120 in Table 19 on page 51.
- 12. Added information about conversion time for Differential mode with Auto Triggering on page 235.
- 13. Added t<sub>WD FUSE</sub> in Table 128 on page 310.
- 14. Updated "Packaging Information" on page 15.

Changes from Rev. 2490B-09/02 to Rev. 2490C-09/02

Changes from Rev. 2490A-10/01 to Rev. 2490B-09/02

- 1. Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.
- 1. Added 64-pad MLF Package and updated "Ordering Information" on page 14.
- 2. Added the section "Using all Locations of External Memory Smaller than 64 KB" on page 33.
- 3. Added the section "Default Clock Source" on page 37.
- 4. Renamed SPMCR to SPMCSR in entire document.
- 5. Added Some Preliminary Test Limits and Characterization Data

Removed some of the TBD's and corrected data in the following tables and pages:

Table 2 on page 22, Table 7 on page 36, Table 9 on page 39, Table 10 on page 39, Table 12 on page 40, Table 14 on page 41, Table 16 on page 42, Table 19 on page 51, Table 20 on page 55, Table 22 on page 57, "DC Characteristics" on page 327, Table 131 on page 329, Table 134 on page 332, Table 136 on page 335, and Table 137 - Table 144.

6. Removed Alternative Algortihm for Leaving JTAG Programming Mode.

See "Leaving Programming Mode" on page 323.

- 7. Improved description on how to do a polarity check of the ADC diff results in "ADC Conversion Result" on page 243.
- 8. Updated Programming Figures:

Figure 138 on page 295 and Figure 147 on page 308 are updated to also reflect that AVCC must be connected during Programming mode. Figure 142 on page 304 added to illustrate how to program the fuses.

- 9. Added a note regarding usage of the "PROG\_PAGELOAD (0x6)" and "PROG\_PAGEREAD (0x7)" instructions on page 315.
- 10. Updated "Two-wire Serial Interface" on page 197.

More details regarding use of the TWI Power-down operation and using the TWI as master with low TWBRR values are added into the data sheet. Added the note at the end of the "Bit Rate Generator Unit" on page 203. Added the description at the end of "Address Match Unit" on page 204.

#### 11. Updated Description of OSCCAL Calibration Byte.

In the data sheet, it was not explained how to take advantage of the calibration bytes for 2, 4, and 8 MHz Oscillator selections. This is now added in the following sections:

Improved description of "Oscillator Calibration Register – OSCCAL(1)" on page 41 and "Calibration Byte" on page 294.

12. When using external clock there are some limitations regards to change of frequency. This is descried in "External Clock" on page 42 and Table 131 on page 329.

13. Added a sub section regarding OCD-system and power consumption in the section "Minimizing Power Consumption" on page 48.

#### 14. Corrected typo (WGM-bit setting) for:

- "Fast PWM Mode" on page 98 (Timer/Counter0).
- "Phase Correct PWM Mode" on page 100 (Timer/Counter0).
- "Fast PWM Mode" on page 151 (Timer/Counter2).
- "Phase Correct PWM Mode" on page 153 (Timer/Counter2).
- 15. Corrected Table 81 on page 191 (USART).
- 16. Corrected Table 102 on page 263 (Boundary-Scan)
